

Class 10: Halloween Mini-Project

Alvin Cheng (A16840171)

Today is Halloween (spooky!) and we will apply lots of the analysis methods and R graphics approaches to find out all about the typical Halloween candy.

```
candy_file <- "candy-data.csv"

candy = read.csv(candy_file, row.names=1)

Q1. How many different candy types are in this dataset?

```
nrow(candy)
```

```
[1] 85
```

Q2. How many fruity candy types are in the dataset?

```
sum(candy$fruity)
```

```
[1] 38
```

```
candy["Twix", ]$winpercent
```

```
[1] 81.64291
```

Q3. What is your favorite candy in the dataset and what is its winpercent value?

```
candy["Ring pop", ]$winpercent
```

```
[1] 35.29076
```

Ring pop is my favorite candy at 35.29076% >Q4. What is the winpercent value for “Kit Kat”?

```
candy["Kit Kat", ]$winpercent
```

```
[1] 76.7686
```

Q5. What is the winpercent value for “Tootsie Roll Snack Bars”?

```
candy["Tootsie Roll Snack Bars", ]$winpercent
```

```
[1] 49.6535
```

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?

win percent is on a different scale to the majority of other columns in the datasets

```
#install.packages("skimr")  
library("skimr")  
skim(candy)
```

Q8. Plot a histogram of winpercent values

```
library(ggplot2)

ggplot(candy, aes(winpercent)) +
  geom_histogram(binwidth = 5, fill = "blue", color = "black", alpha = 0.7) +
  labs(title = "Histogram of win percent", x = "Winpercent", y = "Frequency")
```

Q9. Is the distribution of winpercent values symmetrical?

No the winpercent is not symmetrical.

Q10. Is the center of the distribution above or below 50%?

The distribution looks right skewed so the center of distribution is below 50%.

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

```
choc <- as.logical(candy$chocolate)
choc_winpercent <- candy[choc,]$winpercent

frui <- as.logical(candy$fruity)
frui_winpercent <- candy[frui,]$winpercent

mean(choc_winpercent) > mean(frui_winpercent)
```

```
[1] TRUE
```

Chocolate is higher ranked than fruit candy on average.

Q12. Is this difference statistically significant?

```
t.test(choc_winpercent, frui_winpercent)
```

Welch Two Sample t-test

```
data:  choc_winpercent and frui_winpercent
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 11.44563 22.15795
sample estimates:
mean of x mean of y
 60.92153  44.11974
```

Yes, the p-value is 2.871e-08 which is less than 0.05, so the the difference is statistically significant

Q13. What are the five least liked candy types in this set?

Nik L Nip, Boston Baked Beans, Chiclets, Super Bubble, Jawbusters are the least liked candy.

Q15. Make a first barplot of candy ranking based on winpercent values.

```
library(ggplot2)

ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```

Q16. This is quite ugly, use the `reorder()` function to get the bars sorted by winpercent?

```
ggplot(candy) +  
  aes(winpercent, reorder(rownames(candy), winpercent)) +  
  geom_col(fill = "orange")
```

Define some colors

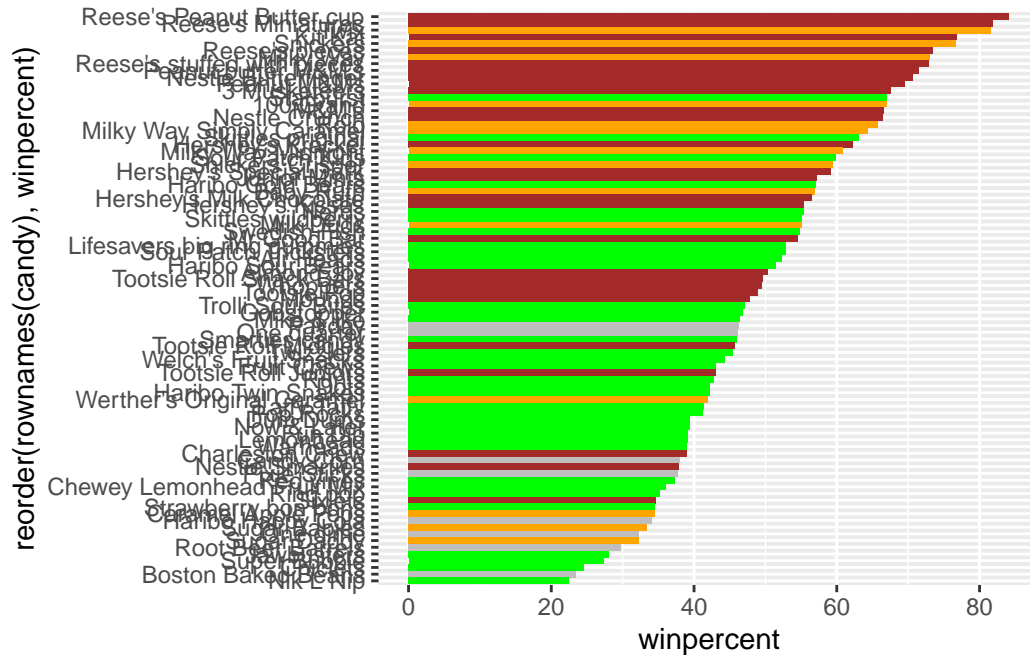

We are going to do some experiments with colors

Distinguishing candy by colors

```
mycols <- rep("gray", nrow(candy))
mycols[as.logical(candy$fruity)] <- "green"
mycols[as.logical(candy$chocolate)] <- "brown"
mycols[as.logical(candy$caramel)] <- "orange"

#mycols

ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col(fill = mycols)
```

Let's setup a color vector (that signifies candy type) that we can then use for some future plots. We start by making a vector of all black values (one for each candy). Then we overwrite chocolate (for chocolate candy), brown (for candy bars) and red (for fruity candy) values.

```
my_cols=rep("black", nrow(candy))
my_cols[as.logical(candy$chocolate)] = "chocolate"
my_cols[as.logical(candy$bar)] = "brown"
my_cols[as.logical(candy$fruity)] = "pink"

ggplot(candy) +
  aes(winpercent, reorder(rownames(candy),winpercent)) +
  geom_col(fill=my_cols)
```

Q17. What is the worst ranked chocolate candy?

Sixlets is the worst ranked chocolate candy

Q18. What is the best ranked fruity candy?

Starburst is the best ranked fruity candy

##4. Taking a look at pricepercent

What about value for money? What is the the best candy for the least money? One way to get at this would be to make a plot of winpercent vs the pricepercent variable. The pricepercent variable records the percentile rank of the candy's price against all the other candies in the dataset. Lower vales are less expensive and high values more expensive.

To this plot we will add text labels so we can more easily identify a given candy. There is a regular `geom_label()` that comes with `ggplot2`. However, as there are quite a few candys in our dataset lots of these labels will be overlapping and hard to read. To help with this we can use the `geom_text_repel()` function from the `ggrepel` package.

```
#install.packages("ggrepel")
library(ggrepel)

# How about a plot of price vs win
ggplot(candy) +
```

```

aes(winpercent, pricepercent, label=rownames(candy)) +
geom_point(col=my_cols) +
geom_text_repel(col=my_cols, size=3.3, max.overlaps = 5)

```

Warning: ggrepel: 65 unlabeled data points (too many overlaps). Consider increasing max.overlaps

Q19. Which candy type is the highest ranked in terms of winpercent for the least money - i.e. offers the most bang for your buck?

Reese's miniatures offered the highest ranked in terms of winpercent for the least money

Q20. What are the top 5 most expensive candy types in the dataset and of these which is the least popular?

Nik L Nip, Nestle Smarties, Ring Pop, Hershey's Krackel, and Hershey's Milk Chocolate are the most expensive candy. Within these 5 most expensive candy is Nik L Nip

```

ord <- order(candy$pricepercent, decreasing = TRUE)
head( candy[ord,c(11,12)], n=5 )

```

	pricepercent	winpercent
Nik L Nip	0.976	22.44534
Nestle Smarties	0.976	37.88719
Ring pop	0.965	35.29076
Hershey's Krackel	0.918	62.28448
Hershey's Milk Chocolate	0.918	56.49050

```
#candy[ord,c(11,12)]
```

##5 Exploring the correlation structure Now that we've explored the dataset a little, we'll see how the variables interact with one another. We'll use correlation and view the results with the corrplot package to plot a correlation matrix.

```
#install.packages("corrplot")
library(corrplot)
```

corrplot 0.92 loaded

```
cij <- cor(candy)
corrplot(cij)
```

Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)?

Chocolate and Fruit are anti-correlated

Q23. Similarly, what two variables are most positively correlated?

Chocolate and winpercent

6. Principal Component Analysis

Let's apply PCA using the `prcomp()` function to our candy dataset remembering to set the `scale=TRUE` argument.

```
pca <- prcomp(candy, scale = TRUE)
summary(pca)
```

Importance of components:

Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you?

Fruity, Hard, Pluribus are strongly picked up by PC1 in the positive direction. Yes, the variables make sense because those variables tend to be correlated with each other. For example, a candy like Starburst and Skittles are fruity, hard and pluribus.
